

NEXA SENTINEL

Liquidation alerts that fire while your phone sleeps

A native Android layer for NEXA EXCHANGE, a live Solana DEX.

Built during CLOCK IN, on a physical Solana Seeker.

github.com/ZNGLABS/nexa-mobile

THE PROBLEM

Close the tab and it stops existing.

NEXA EXCHANGE is live: spot swaps and Phoenix Flight perpetuals, on the Solana dApp Store since July 2026. Its Android app is a TWA — a wrapper around the site. Your rules say wrappers score poorly. They are right, and here is why it matters.

- A browser tab stops running the moment it is closed.
- A leveraged position does not stop moving.
- The gap between those two sentences is where people get liquidated.

What a trader needs from a phone is one thing:

to be told something happened while they were not looking.

WHAT WE BUILT

Things a web page cannot do.

Background monitor

A foreground service polls Phoenix every 60 s and survives the app being closed.

Survives reboot

BOOT_COMPLETED recovery. An alert set at night is still armed in the morning.

Home screen widget

Live mark price, no app to open.

Liquidation alerts

Fires at 15 / 8 / 3 % from the liquidation price.

Mobile Wallet Adapter

Connect and disconnect. The app never holds a private key.

THE PART WE ARE PROUDEST OF

The liquidation price is the program's own number.

The app does not estimate where you get liquidated. It builds Phoenix's own read-only view instruction, simulates it — nothing is ever sent — and reads the program's computation out of the transaction return data.

PROGRAM ANSWER

74.7788

INDEPENDENT MATHS

0.0012

DIFFERENCE, TICK ROUNDING

Checked on mainnet, 16 Sept 2026, against a real 0.02 SOL long entered at 97.38.

Base58, transaction serialisation and the 56-byte return decoding: written in Kotlin, no SDK, each verified separately against the official tooling before being trusted.

A reason to keep it installed.

Most hackathon apps are opened once. This one earns a permanent place on the home screen because it works when you are not looking at it.

- The widget is glanced at, not opened — the lowest-friction habit there is.
- A liquidation alert is the notification you cannot afford to mute.
- It runs against the 82 markets Phoenix already has, including stocks and commodities.
- It costs nothing to keep: no account, no server, no subscription.

The Seeker audience is exactly the audience that keeps a position open overnight.

THIS IS NOT A MOCKUP

The product behind it is live.

PERP MARKETS

4.6

DAPP STORE RATING

10 bps

REGISTERED BUILDER

On 17 September, hours after the points engine went live, a real user traded **\$2,533.56 of perpetual volume and earned 759 NX points.**

Two fills, both at exactly 10 bps — the builder code NEXA is registered under.
The revenue is real, measured on chain, and not ours to invent.

NEXA is a registered Phoenix Flight builder. The DEX has been live since July 2026.

WORK DONE INSIDE THE WINDOW

Every commit is in the window.

12 Sept

REPOSITORY CREATED

2,786

LINES OF KOTLIN

27

COMMITTS

github.com/ZNGLABS/nexa-mobile is a new, public repository. 16 Kotlin files, a separate application id so it installs beside the published app on the same device, and CI that builds and publishes a downloadable APK on every commit.

The repository history is the evidence. Nothing here predates 12 September 2026.

TESTED ON A DEVICE, NOT AN EMULATOR

Five defects compiling never found.

Recorded on a physical Solana Seeker and watched frame by frame. That review found what a green build had not:

- A locale bug printing \$76 761,00 in an English interface.
- An alerts list that pushed the market list off screen.
- Rows re-sorting under the reader's finger every ten seconds.
- A widget that would have stayed blank forever if the monitor was off.
- A disconnect flow that demanded wallet approval just to forget a wallet.

All five are fixed, and all five are in the commit history.

WHAT WE ARE NOT CLAIMING

The honest part.

Order placement stays on the web view

Re-encoding Phoenix order instructions in Kotlin, with real money at stake and no test bench, was not reasonable inside the window. A deliberate boundary beats a rushed one.

Logos are frozen at build time

A market Phoenix opens after our build falls back to a coloured tile drawn from the live API.

No SKR integration

SKR is one of the 82 markets we track. That is not an integration and we will not call it one.

A judge prefers a boundary you state to one they discover.

Everything in the demo runs on a Seeker, today.
